Résumé

Cette documentation décrit le fichier Python qui initialise un dictionnaire stockant des métadonnées sur les variables PLC (Automate Programmable Industriel). Chaque entrée comprend le type de données de la variable et son adresse logique dans la mémoire du PLC, nécessaire pour les tâches de manipulation des données.

1 Introduction

Ce document présente le script Python "variablesAPI.py" utilisé pour définir un dictionnaire appelé `variables`, qui stocke les variables du PLC et leurs propriétés telles que le type de données et l'adresse logique. Ce dictionnaire est essentiel pour les systèmes d'automatisation nécessitant la lecture et l'écriture des données dans un PLC.

2 Contenu du script Python

2.1 Structure générale

Le script initialise un dictionnaire avec des variables de type entier et booléen, chacune étant associée à une adresse logique spécifique dans le PLC.

2.2 Détail du script

Le script Python est présenté ci-dessous avec des explications pour chaque partie importante.

```
1 # -*- coding: utf-8 -*-
2 """ Define a dictionary called 'variables' to store PLC
   variables and their properties """
3 variables = {
4     # Integer type variables with their logical addresses in
      the PLC
5     "Mw_API_CVEntree": {"Data Type": "Int", "Logical Address"
      : "%MW506"},
6     "Mw_API_CVSortieStandard": {"Data Type": "Int", "Logical
      Address": "%MW508"},
7     "Mw_API_CVSortieSecours": {"Data Type": "Int", "Logical
      Address": "%MW510"},
8     "Mw_master_nb_billes_entree": {"Data Type": "Int", "
      Logical Address": "%MW500"},
9     "Mw_master_nb_billes_sortie_normal": {"Data Type": "Int",
      "Logical Address": "%MW502"},
10    "Mw_master_nb_billes_sortie_secours": {"Data Type": "Int"
      , "Logical Address": "%MW504"},
11
12    # Boolean type variables for control, indication, and
      alarms with their specific bit addresses in the PLC
13    "Mx_master_start": {"Data Type": "Bool", "Logical Address
      ": "%M320.1"},
14    "Mx_master_pause": {"Data Type": "Bool", "Logical Address
      ": "%M320.0"},
15    "Mx_master_multi_possible": {"Data Type": "Bool", "
      Logical Address": "%M320.2"},
16    "Mx_master_multi+de3": {"Data Type": "Bool", "Logical
      Address": "%326.2"},
```

```
17     "Mx_master_demande_mode_multi": {"Data Type": "Bool", "
    Logical Address": "%M301.6"},
18     "Mx_master_alarme_urgence": {"Data Type": "Bool", "
    Logical Address": "%M325.0"},
19     "Mx_master_quittance_obstruction": {"Data Type": "Bool",
    "Logical Address": "%M325.3"},

2.2.1 Définition du dictionnaire variables

Le dictionnaire `variables` est utilisé pour stocker les métadonnées des variables PLC. Chaque entrée du dictionnaire contient le type de données de la variable (`Int` pour entier et `Bool` pour booléen) ainsi que son adresse logique dans la mémoire du PLC.

```
1 variables = {
2     "Mw_API_CVEntree": {"Data Type": "Int", "Logical Address"
3         : "%MW506"}},
4     "Mw_API_CVSortieStandard": {"Data Type": "Int", "Logical
5         Address": "%MW508"}},
6     "Mw_API_CVSortieSecours": {"Data Type": "Int", "Logical
7         Address": "%MW510"}},
8     "Mw_master_nb_billes_entree": {"Data Type": "Int", "
9         Logical Address": "%MW500"}},
10    "Mw_master_nb_billes_sortie_normal": {"Data Type": "Int",
11        "Logical Address": "%MW502"}},
12    "Mw_master_nb_billes_sortie_secours": {"Data Type": "Int"
13        , "Logical Address": "%MW504"}},
14    "Mx_master_start": {"Data Type": "Bool", "Logical Address
15        ": "%M320.1"}},
16    "Mx_master_pause": {"Data Type": "Bool", "Logical Address
17        ": "%M320.0"}},
18    "Mx_master_multi_possible": {"Data Type": "Bool", "
19        Logical Address": "%M320.2"}},
20    "Mx_master_multi+de3": {"Data Type": "Bool", "Logical
    Address": "%326.2"}},
    "Mx_master_demande_mode_multi": {"Data Type": "Bool", "
    Logical Address": "%M301.6"}},
    "Mx_master_alarme_urgence": {"Data Type": "Bool", "
    Logical Address": "%M325.0"}},
    "Mx_master_quittance_obstruction": {"Data Type": "Bool",
    "Logical Address": "%M325.3"}},
    "Mx_master_quittance_urgence": {"Data Type": "Bool", "
    Logical Address": "%M325.1"}},
    "Mx_master_connecte": {"Data Type": "Bool", "Logical
    Address": "%M310.0"}},
    "Mx_master_alarme_obstruction": {"Data Type": "Bool", "
    Logical Address": "%M325.3"}},
    "Mx_master_quittance_distribution": {"Data Type": "Bool",
    "Logical Address": "%M325.5"}},
    "Mx_master_quittance_sortie_secours": {"Data Type": "Bool
    ", "Logical Address": "%M325.7"}},
    "Mx_master_alarme_surveillance_bille": {"Data Type": "
    Bool", "Logical Address": "%M326.0"}},
```

```

21     "Mx_master_quittance_surveillance_bille": {"Data Type": "
        Bool", "Logical Address": "%M326.1"},
22     "Mx_API_C1_attention": {"Data Type": "Bool", "Logical
        Address": "%M135.4"},
23     "Mx_API_C1_alerte": {"Data Type": "Bool", "Logical
        Address": "%M135.0"},
24     "Mx_API_C2_attention": {"Data Type": "Bool", "Logical
        Address": "%M135.5"},
25     "Mx_API_C2_alerte": {"Data Type": "Bool", "Logical
        Address": "%M135.1"},
26     "Mx_API_C3_attention": {"Data Type": "Bool", "Logical
        Address": "%M135.6"},
27     "Mx_API_C3_alerte": {"Data Type": "Bool", "Logical
        Address": "%M135.2"},
28     "Mx_API_C4_attention": {"Data Type": "Bool", "Logical
        Address": "%M135.7"},
29     "Mx_API_C4_alerte": {"Data Type": "Bool", "Logical
        Address": "%M135.3"},
30 }

```

3 Conclusion

Ce script Python est essentiel pour les systèmes d'automatisation nécessitant l'interaction avec un PLC. En définissant un dictionnaire de variables avec leurs types de données et adresses logiques, il permet de simplifier et de structurer les tâches de manipulation des données dans les systèmes d'automatisation.
